

What's New

What's New

This document provides a quick overview of the new features in **EURSvalidator 2.0 SP2**.

New Graphical User Interface (GUI)

The GUI has been redesigned, holding three main frames: **Submission Explorer**, **Result Explorer**, and **Information Explorer**.

Adding Submissions

There is now a variety of ways to load a single or multiple submissions into EURSvalidator. Using the **Add** button in the toolbar, you can select a folder from your local file system. EURSvalidator checks this folder and all subordinated folders for valid submissions and adds these to the **Submissions Explorer**.

Alternatively, you can use the drag and drop feature: Simply drag a folder from a Windows explorer window into the **Submissions Explorer**.

Auto Detector

The automatic validation set detection was sped up. An auto detection color code was added: Validation sets successfully detected automatically are displayed in green font color. If no validation set could be detected, the field entry is displayed in red font color.

A manual selection of validation sets is still possible at any time.

Mass Validation

The **Start Validation** button in the main toolbar starts the validation for all pending submissions in the **Submission Explorer**.

Improved Validation Documentation

The new online help provides detailed information about the validation mechanism in EURSvalidator. Both positive and negative tests are documented.

CITRIX Support

EURSvalidator is now supported in a CITRIX environment.

New Validation Report

The PDF report is harmonized. Basically long and short reports contain the same information. In addition, the long report provides results per file. Additionally, the report functionality is enhanced by the 'send mail' option: Long and short reports are created; the installed mail program is opened automatically. A new email with the attached reports is created.

Validation Criteria Sets for Croatia

The following validation criteria sets for Croatia have been added:

- HR eCTD v3.1
- HR NeeS v2.1
